Compact VLT® quality

VLT® Micro Drive is a genuine VLT® frequency converter with unsurpassed reliability, user-friendliness, condensed functionality, and is extremely easy to commission. Terminal numbers are named in the same manner as in the rest of the VLT® family.

Reliable and user friendly

The VLT® Micro Drive is a full member of the VLT® family, sharing the overall quality of design, reliability and user-friendliness.

Compact general purpose drive

The VLT® Micro Drive is a general purpose drive that can control AC motors up to 22 kW.

Compact design – Uncompromised quality

Space saving

A compact, book-style design allows side-by-side mounting without derating.

Minimum penetration of dust

VLT® Micro Drives are designed to keep the forced ventilation away from the electronics. Printed circuit boards are well protected inside the drive.

Built-in RFI

Radio disturbance from motor cables is limited with the built-in RFI filter, which allows for 15 m motor cables (screened). Meets EU norms.

Built-in brake functions

With built in DC and AC brake functions, VLT® Micro Drive can transform kinetic energy in the application into braking

power to slow down the motor. A brake chopper is built in the drives from 1.5 kW upwards.

Intelligent heat management

Process heat is removed through the heat sink, leaving electronics protected from dust and dirt from production.

Coated electronics are standard

All VLT® Micro Drives use coated electronics for longer lifetime and reliability.

Effective heat sink

An effective heat sink removes heat from the electronics and extends the lifetime and reliability of the drive.

Energy efficiency 98%

High quality VLT® power modules ensure cool running of the drive due to low losses.

50° ambient temperature

Highly efficient cooling allows up to 50° ambient temperature.

Built-in Smart Logic Controller

The smart logic controller is a simple, yet clever, way to make your drive, motor and application work seamlessly together.

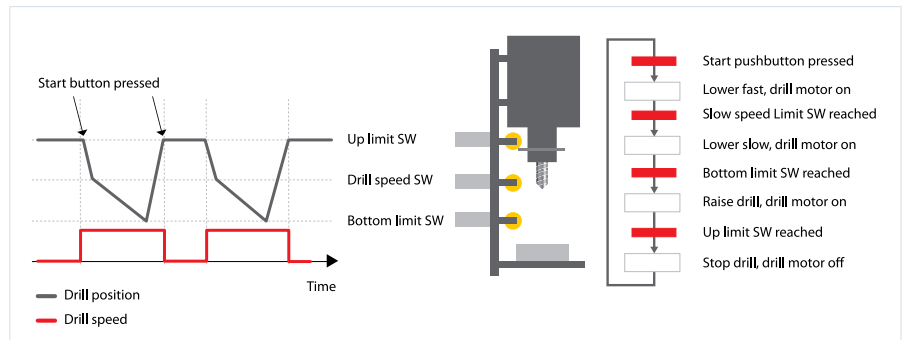

The smart logic controller is able to monitor any parameter that can be characterized as "true" or "false".

This includes digital commands and also logic expressions, which allow even sensor outputs to influence the operation.

Temperature, pressure, flow, time, load, frequency, voltage and other

parameters combined with the operators ">", "<", "=", "and" and "or" form logic expressions that are true or false. That is why Danfoss calls it a "logic"

controller. As a result of this, you can program the controller to react to literally any event.

Option – VLT® Line Filter MCC 107

Improve both the low and high frequency performance of the line current to the drive with the optional VLT® Micro Drive Line Filter, which boosts efficiency by combining a harmonic filter and an EMC filter.

Increased drive lifetime

Reducing the voltage ripple on the DC link will result in higher reliability and longer drive lifetime. Under similar running conditions (temperature, load), the expected lifetime of the DC capacitors may be extended by 2-3 times.

Improved power-factor

The VLT® Line Filter reduces the RMS value of line current. A smaller line current means higher true power-factor (PF). Typically, line current can be reduced by more than 40% and improve PF from 0.4 to 0.7 for single-phase drives and 0.47 to 0.9 for three-phase drives.

Improved high frequency conduction EMC performance

The VLT® Line Filter ensures compliance with EN55011 class A1 for up to 50 m of motor cable, and class B up to 10 m of motor cable.

That means the VLT® Micro Drive + VLT® Line Filter, has an outstanding EMC performance in the micro-inverter class, even with relatively long motor cables.

High immunity against grid disturbances

The line filter will reduce the harmonic current drawn from the grid. The drive will comply with IEC 61000-2-2 and IEC 6100-2-4 without power derating, including 15% harmonic voltage distortion, 3% voltage imbalance and commutation notches, as described in IEC 60146-1. With the line filter, the performance of the immunity to the surge and burst impact of the drive stated in IEC 61800-3 will be greatly improved.

One filter for several drives

The line filter can be used for filtering several small VLT® Micro Drives. In this case the line filter should be derated by one size.

Example: 1 x FC 51 400 V/1.5 kW + 1 x FC 51 400 V/1,5 kW -> total 3.0 kW + derating one size up: select filter 400 V/4.0 kW.

Frame sizes
Three different frame sizes of line filters correspond to the M1, M2 and M3 enclosures of the VLT® Micro Drive
